

ARCHITECTURE  
HEALTH +  
WELLBEING

# The 5th International Conference on Empathic Architecture (ICEA)

Human spends a large proportion of their time indoors. A causal relationship exists between the indoor environment and human health (Boubekri, 2008). Architecture can impact human health, happiness, and physiological function (St-Jean et al., 2022). The architecture design should serve the user's individual and collective needs, protect the health, and encourage well-being. It is essential to seek a holistic understanding of the impact of architecture on human health and well-being.
